Introduction

Summary

Sleeper Agent is a stealth FPS game based in a fictional country. In the game, the player will play the role of a secret agent, his purpose being to infiltrate enemy lines while trying to avoid arousing suspicion.

Game Pillars

The following are

- The player must always feel threatened by the environment around him.
- Engaging in a firefight is dangerous; the player must avoid this scenario at all costs.
- Being an undercover agent, the available loadout will be small (a silenced pistol and a lockpick).

Target Audience

Due to its stealth nature with shooter elements, the game is suitable for individuals in their mid-20s who have enjoyed games such as Splinter Cell and Hitman and are fond of close-quarters combat. Players take on the role of a sleeper agent, engaging in missions that require careful planning, strategic thinking, and precise execution.

The game appeals to those who appreciate the challenge of remaining undetected, outsmarting adversaries, and performing stealthy, tactical operations.

Platform

The game is developed to be released on windows PC

Gameplay

Overview

The game draws inspiration from the early chapters of the Splinter Cell series, emphasizing the stealth aspect. By evading enemies and taking advantage of blind spots, the player must be able to collect the necessary intel.

Core Mechanics

In the game, the player will be able to use different mechanics to achieve their goal. A list of them can be found here with a deeper analysis on how they work.

Movement

The player will be able to move around the environment around him, to which is added the ability to crouch (useful for passing behind certain objects without being seen) and the ability to climb ladders.

Shooting

As for shooting, the player must feel able to use his weapon not only to eliminate enemies but also to disarm them or destroy lights and cameras.

In addition, to facilitate room entrances, the player has the option to lean to the right or left, which is very useful in CQB environments.

Interrogating

One of the main mechanics is interrogation. Since the protagonist is a sleeper agent, much of the information must be obtained in the field.

By approaching the enemy from behind, the player will have the opportunity to interrogate him. However, not all enemies will have important information, some will beg to be left while others may as well threaten the player.

Unlocking Doors

There are two types of locked doors in the game:

The first one can be opened with the lockpick, the player has to solve a mini-game to open it.

The second one are doors locked with a code, the player could find it in the surroundings or interrogate the enemies that pass through there.

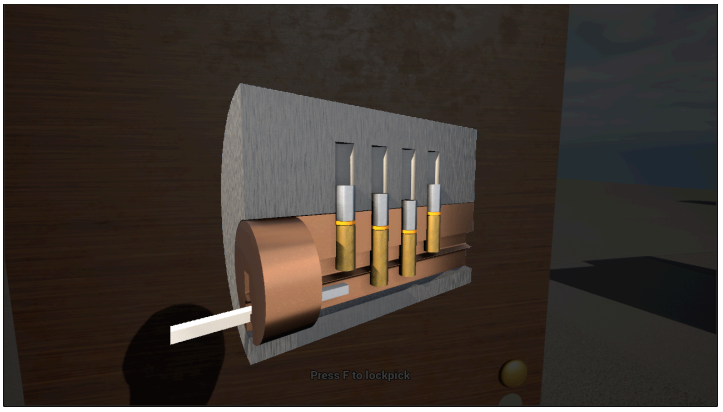
A deeper analysis can be found in the Minigame section

Minigame

As mentioned in the Unlocking doors section, the player will need to complete a mini-game to open the locked doors, here is the explanation of how each of these mini-games works and images of what it will look like.

Lockpicking

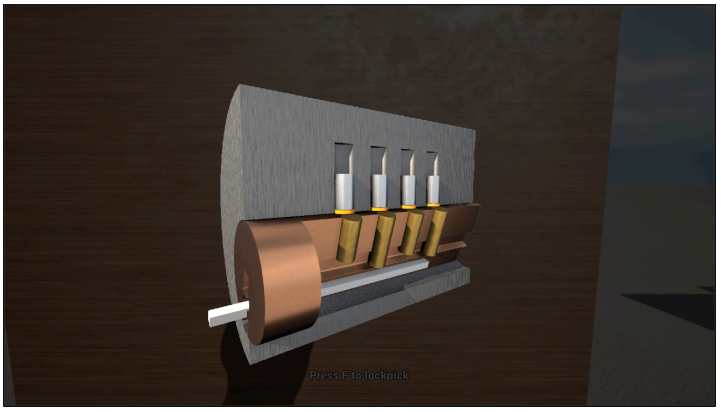
When the player approaches a locked door, they will be able to lockpick it.



Once the minigame has started, the player will see a 3D model of a lock. Inside this model, 4 pins can be found.

As you can see in the image to the right, each pin has a "golden" section that must be aligned with the line between the brass and the metal part of the lock.

Only one pin at a time can be moved up, and each time this happens, a new one is selected with a higher chance of being the same. The player can move between the pins and the lockpick, the white rectangle, will show the selected one.



When all pins are moved to the correct position, as shown on the right, an animation will play and the door can now be opened at any time.

Success

In this minigame the success is achieved once the player aligns all the pins in the correct position. An audio cue plays each time a pin is moved correctly.

Failure

Since the time in the game will not be stopped when the minigame starts, the actual failure is caused by the loss of time from the player. Each time the player tries to move a pin that cannot be moved, an audio cue (similar to the sound of trying to open a locked padlock) will play.

Keypad

These are a type of doors that are less present but that the player must necessarily open to continue. These doors always have a numeric keypad next to them; this is needed to be able to enter the code.

As seen in the image next to it, once the player interfaces to the keypad they will have the option of entering a four-digit code. Also by taking advantage of the keys located in the lower left or lower right corner he will be able to either delete the number entered or confirm the code.

The code can be found in two ways:
The first is to query a guard passing through that door, as he will be aware of the code to be entered.
The second requires looking for the code in an area near the door, sometimes it may happen that some forgetful guard will mark the code on a post-it note or leave it clearly visible on the computer screen, it will be up to the player to be able to find it.

Success

In this minigame the success is achieved once the player puts the correct 4 digit code, an audio cue will play.

Failure

If the player fails to put the correct code, if there is one, a guard will go to check what happened at the door location. Once the wrong code is submitted, an audio cue will play.

Weapons

Overview

There are several types of weapons in Sleeper Agent. These can be grouped into 5 different categories:

- Pistols, guns with medium range and low number of bullets in the magazine.
- Rifles, guns with medium-long range and high number of bullets in the magazine.
- Shotgun, short-range weapons that can fire multiple rounds.
- Submachine gun, similar to the pistol, but can shoot faster and do less damage.
- Sniper rifle, long-range guns with a low number of bullets in the magazine that can deal heavy damage.

Weapons Variable

For each of the weapons present it is possible to change certain values, specifically

Silenced

This value determines whether the weapon is silenced or not. This affects the AI's hearing. (Boolean)

Burst

This value determines whether the weapon fires a single shot, whether the fire input is pressed or held, or whether it continues firing if held. (Boolean)

Damage

How much damage each bullet does. (Float)

Fire Rate

This determines how long between each shot is fired. (Float)

Head Multiplier

This represents the value by which the damage should be multiplied in case of headshot. (Float)

Reload Speed

The time to wait to reload a magazine and be able to shoot. (Float)

Magazine Size

How many bullets can fit in a magazine. (Integer)

Number of pellets

Only for shotguns, how many pellets are shot for each buckshot. (Integer)

Range

This value represents the maximum range within which the weapon is effective. (Integer)

Recoil Y

How much the gun recoils on the Y axis. (Float)

Recoil X

How much the gun recoils on the X axis. (Float)

Zoom

The magnifying multiplier of the gun while the player is aiming. (Float)

Reload Anim

This value determines which animation must be played when the player is reloading the gun. (Anim Montage)
